

ABSTRACT

A portable test compartment allows for on-site pressure testing of a workpiece at the site where the workpiece is utilized, instead of having to haul the workpiece to an off-site testing location. A test vehicle carries the elongated test compartment, and travels to the on-site location to test the workpiece. The vehicle has a lift assembly that pivotally connects the vehicle and the compartment. The lift assembly moves the compartment from a storage position alongside the vehicle to an operational position alongside the ground. The compartment has an interior portion that receives the workpiece. Inside the compartment, a safety blanket is fastened to the bottom of the compartment. The safety blanket envelops the workpiece by folding several portions of the blanket around the workpiece.
